

## Top Green Tip

**TURN IT OFF!** It is estimated that standby modes are causing 1% of the world's greenhouse gas emissions - close to what the entire aviation industry emits! A typical European home is likely to have 20 devices constantly drawing standby power at any one time. This contributes to between 5-10% of total electricity use in the home. There has never been an easier way to do your bit in the fight against global warming than simply turning the switch off at the wall!
